1) **Total Premium Amount** – **Total Premium Amount** usually means the **sum of all premiums paid.**
   Total Premium Amount = Annual Premium × Number of Years (or Payment Terms)

2) **Total Annual Premium** - **Total Annual Premium** means the **amount you need to pay in premiums in one year** for a given policy
   Based on the Payment Frequency.

Payment Frequency	Multiplier
Monthly	× 12
Quarterly	× 4
Half-Yearly	× 2
Yearly	× 1

3) **Total Premium Paid** - **Total Premium Paid** means the **entire amount of money Policy Holder have paid (or will pay) over the full duration of the policy**, considering the payment frequency and the number of years the policy runs.
   `[Total Annual Premium] * [Premium Payment Duration]`

4) **Maturity Amount** - **Maturity Amount** means the **total sum of money the policyholder will receive at the end of the policy term**, provided all premiums have been paid as per the agreement. It is based on the Return Rate Matrix by Policy Type, Premium & Tenure

5) **Premium Payment Duration** - **Premium Payment Duration** means the **number of years for which the policyholder is required to pay premiums** to keep the policy active.

6) **Premium Amount Payable** - **Premium Amount Payable** means the **amount of money the policyholder needs to pay to the insurance company** as per the premium schedule (monthly, quarterly, half-yearly, or yearly) to keep the policy active.

7) **Annualized ROI (%)** - Annualized ROI (%) means the **average return per year** you earn on your investment (Return on Investment)

$$\text{Annualized ROI (\%)} = \left(\left(\frac{\text{Final Value}}{\text{Total Invested}} \right)^{\frac{1}{\text{Years}}} - 1 \right) \times 100$$

- Final Value = Maturity Amount or current value
- Total Invested = Total premium paid (your contributions)
- Years = investment duration in years

Example 1 (Simple)

- You invested **₹1,00,000**
- After 3 years, you got **₹1,33,100**

Total ROI = **33.1%** (over 3 years)

Annualized ROI =

Annualized ROI =

$$\left(\frac{133100}{100000}\right)^{\frac{1}{3}} - 1 = 0.10 = 10\%$$

Means you earned **10% every year** (compounded).

8) CAGR (%) - **Compound Annual Growth Rate**
It measures the **average annual growth rate of an investment** over a period of time, assuming the investment has been compounding.

$$CAGR = \left(\frac{Final\ Value}{Initial\ Value}\right)^{\frac{1}{n}} - 1$$

- **Final Value** → Value at the end of the period (Maturity Amount, Investment Value etc.)
- **Initial Value** → Value at the start of the period (Total Premium Paid / Invested Amount)
- **n** → Number of years (Tenure of the policy/investment)

Example 1 (Simple)

- Initial Investment (IV) = ₹1,00,000
- Final Value (FV) = ₹2,00,000
- Time = 5 years

$$CAGR = \left(\frac{200000}{100000}\right)^{\frac{1}{5}} - 1 = (2)^{0.2} - 1 = 0.1487 = 14.87\%$$

Investment grew at **14.87% per year (compounded)**.

Maturity Amount- Based on Total Annual Premium, Tenure, Policy Status and Policy Name
