Business Goals

- This project focuses on creating an interactive Insurance Policy Analysis Dashboard in Microsoft Power BI using a dataset containing records from 2015 to 2025.
- The dataset captures the complete insurance policy lifecycle, including policy creation, tenure, customer details, claims, loan information, and maturity calculations.
- The goal is to provide a single, unified view of the insurance business, enabling stakeholders to track policy performance, analyze claims, forecast maturity amounts, and assess business unit contributions.
- Track how different insurance policy types are performing across various customer segments.
- Understand which Policy Types and which state are performing well or underperforming.
- Identify top-performing policy plans and flag those with low customer uptake.
- Monitor claim settlement performance and detect inefficiencies in the claims process.
- Improve accountability and performance across the sales, claims, and loan servicing teams.
- Automate the report refresh to ensure stakeholders always see the latest data.
